Introduction to the JVM

The Java Virtual Machine and the main method

Agenda

☐ Files in Java

☐ Java Virtual Machine (JVM)

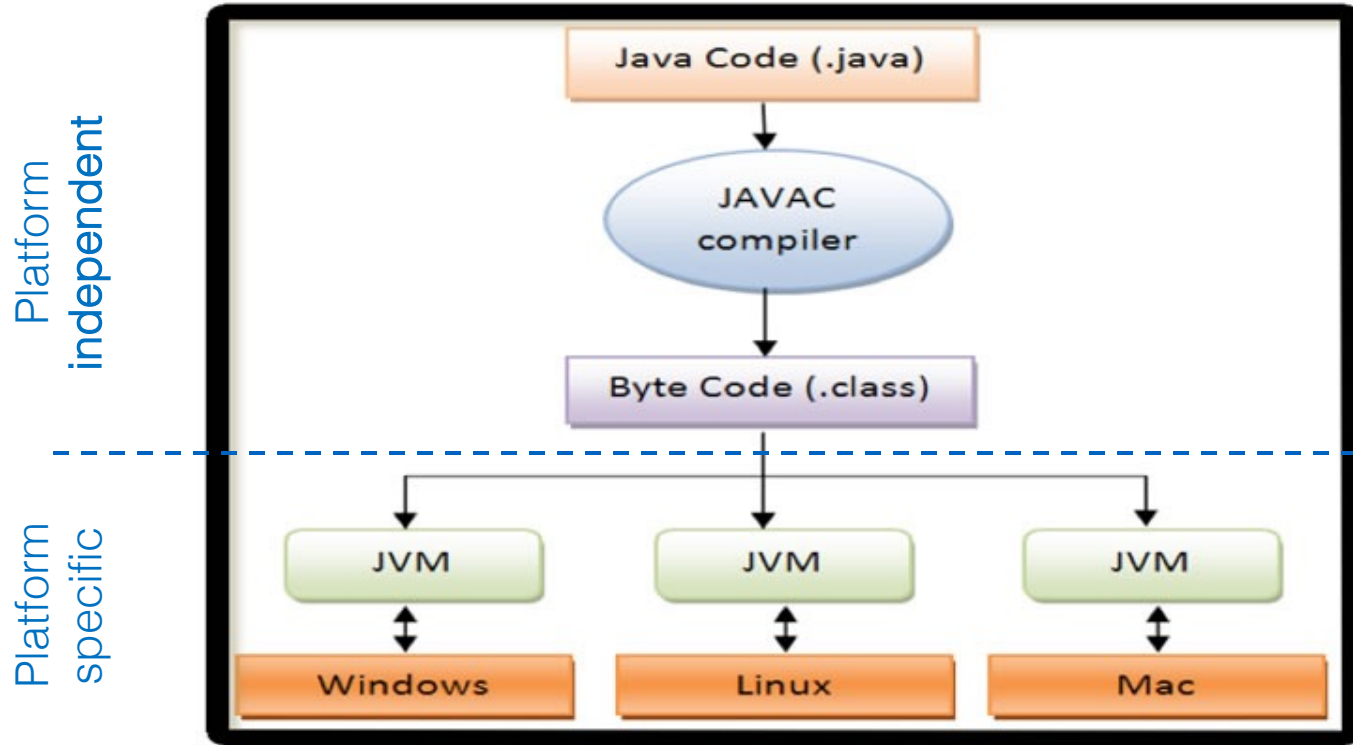

☐ `main()` method

Files in Java

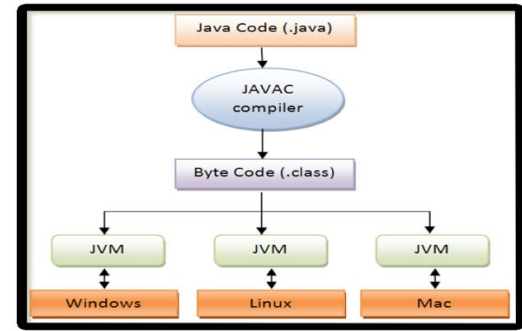

Files in Java

Files in Java

- ❑ Java code is written in **.java** file
 - code contains one or more Java language constructs e.g. Classes, Methods, Variable, Objects etc.
- ❑ Compiling this code generates a **.class** file
- ❑ A **.class** file
 - “byte code”
 - the input to Java Virtual Machine (JVM)
- ❑ The JVM (for a specific platform) reads this byte code, interprets it as machine code instructions (for that platform) and executes the program (on that platform)

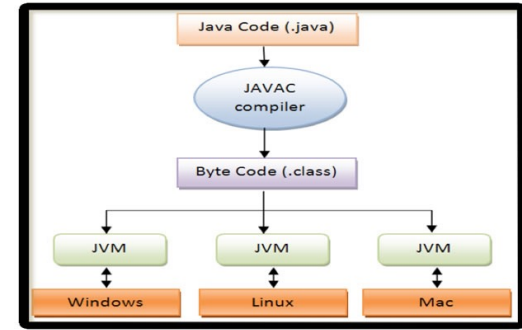

Java Virtual Machine (JVM)

Java Virtual Machine (JVM)

- ❑ A “**virtual**” computer that resides in the “**real**” computer as a software process
- ❑ Gives Java the flexibility of **platform independence**.
- ❑ The **.class** files can be run on any OS, once a JVM has been installed
 - (NB: JVM is installed when you install the JDK).

main() method

main() method

- ❑ When you want to run a java project, the Java Virtual Machine (JVM) invokes the **main()** method in the project
- ❑ For the JVM to recognise it, the main() method must have a specific method **signature**

```
public static void main(String[] args)
{
    ...
}
```

main() method - signature

- ❑ “main” must exist
- ❑ “main” must be **public**
- ❑ “main” must be **static** (class method)
- ❑ “main” must have a **String array parameter**
- ❑ Only “main” can be invoked automatically

```
public static void main(String[] args)
{
    ...
}
```

The `main()` method typically...

```
public static void main(String[] args)
{
    Driver driver = new Driver();
    driver.runMenu();
}
```

Creates an object

Calls the first
method

Questions?

Thanks.
