# Iteration in Programming

while loops & loop control variables

## Loop recap

**for loop**  
The Java for loop is used to iterate a part of the program several times. If the number of iteration is fixed, it is recommended to use for loop.

**while loop**  
The Java while loop is used to iterate a part of the program several times. If the number of iteration is not fixed, it is recommended to use while loop.

**do-while loop**  
The Java do-while loop is used to iterate a part of the program several times. Use it if the number of iteration is not fixed and you must have to execute the loop at least once.

### The use of Loop Control Variables

# Agenda

---

- ☐ Repetition in Programming – Intro to looping
- ☐ Use of loops (while loops)

# Repetition in Programming

---

## Intro to looping

# Recap: Boolean conditions

---

- A **boolean** condition is an expression that evaluates to either true or false e.g.

`x < 50`

- Boolean conditions can be used to control:
  - Selection i.e. if statements and
  - Iteration i.e. loops (we will look at these now)

# Repetition in Programming

---

☐ Computers are very good at repetition

☐ Example:

- `calculate pay` for 1000 employees
- You should use the same `calculate pay` algorithm 1000 times
- You don't write the `calculate pay` algorithm 1000 times; instead you include it in a loop

# Form of loop

---

- Write the all the numbers between 1 and 5 inclusive
  - Without loop:

```
System.out.println(1);  
System.out.println(2);  
System.out.println(3);  
System.out.println(4);  
System.out.println(5);
```

# Form of loop

---

- Write the all the numbers between 1 and 5 inclusive
  - With a loop:
    - ◆ do this 5 times

```
System.out.println(i);
```

*With the value of i going from 1 to 5*

# Use of loops (while loops)

---

# Loops in Programming

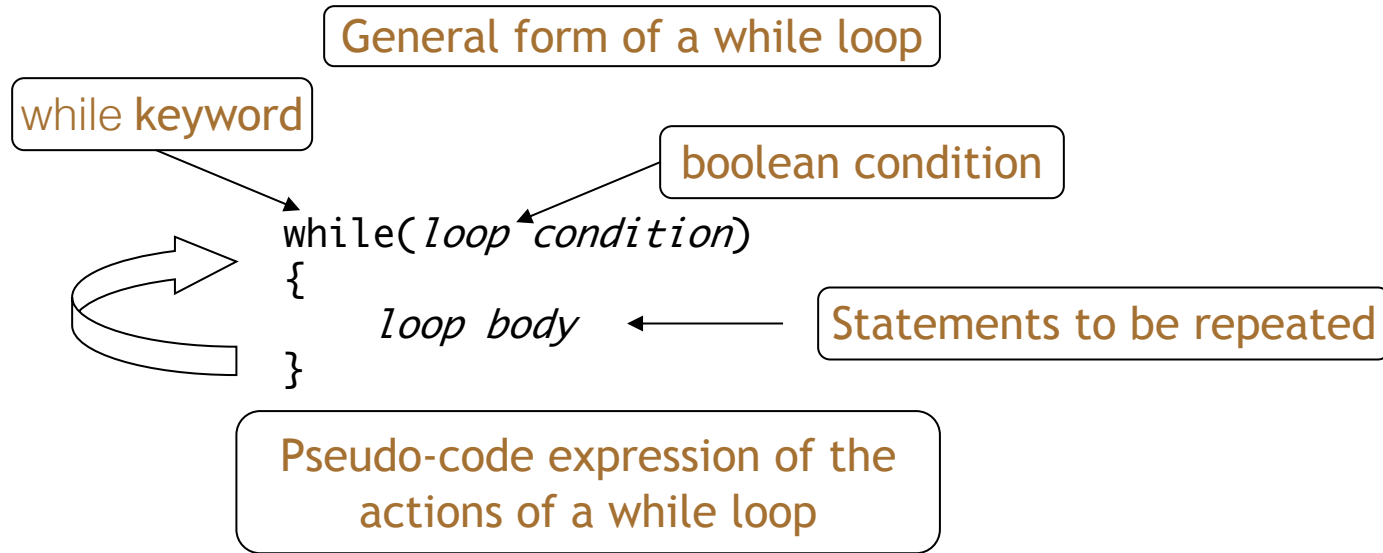

---

□ There are three types of loop in (Java) programming:

- **while** loops
- **for** loops
- **do while** loops

# while loop pseudo code

while we wish to continue, do the things in the loop body

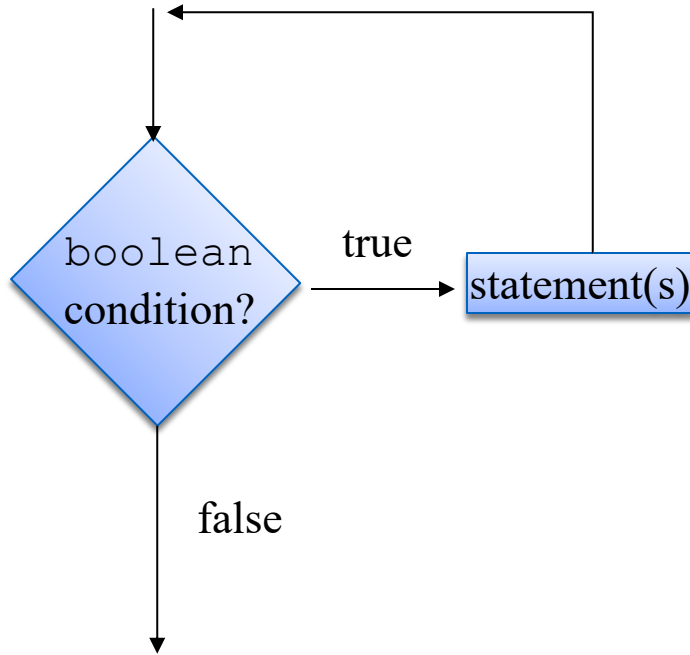

# Construction of while loop

---

```
Declare and initialise loop control variable (LCV)
while(boolean condition based on LCV is true)
{
    "do the job to be repeated"
    "update the LCV"
}
```

This structure should always be used

# while loop Flowchart

```
int i = 1;           //i is the LCV
while(i <= 5)
{
    System.out.println(i);
    i++;
}
```

# Processing Example 4.5

```
int i = 1; //i is the LCV
while(i <=5)
{
    System.out.println(i);
    i++;
}
```

Declare and initialise **loop control variable (LCV)**  
while(boolean condition based on **LCV** is true)  
{  
    “do the job to be repeated”  
    “update the **LCV**”  
}

# Some Study Exercises

---

This basic while loop,  
produces this output.

```
int i = 1;

while (i <=5)
{
    println("Hello World");
    i++;
}
```

```
Hello World
Hello World
Hello World
Hello World
Hello World
```

# Some Study Exercises

---

1. Change the code so that “Hello World” is printed out 10 times.
2. Change the code so that the numbers from 1 to 10 (inclusive) are printed out, one line at a time.
3. Change the code so that the numbers from 10 to 1 are printed out.

# Questions?

---

# Questions?

---

Thanks.
